

INTERFACE AND APPLICATION PROGRAMMING

- On this assignment the objective was to write a user interface for an input or output device using different languages
- The only language that I was a little comfortable with was python
- I firstly read different manuals downloaded from the web for python as to find the book learning python was a challenge and believe me it was not easy as time waits for no man .
- To me python was like C language and that became an advantage as I have learned C language before.
- I wrote a program and complied it for AVR micro controller ATTiny44.
- But I did not complete the task as I did not build the board and program it.
